

SafePlay Database Deployment Guide

✓ Issues Fixed

1. TypeScript Error in AI Insights Route

- **Issue:** `createdAt` field not found in `AIInsightOrderByWithRelationInput` type
- **Fix:** Changed `orderBy: { createdAt: 'desc' }` to `orderBy: { timestamp: 'desc' }` in `/app/api/ai/insights/route.ts`
- **Status:** ✓ Fixed and committed

2. Database Schema Creation

- **Issue:** Database connected but no tables existed
- **Fix:** Database schema is already in sync with Prisma schema
- **Status:** ✓ Verified with `prisma db push`

Production Deployment Commands

For Vercel Deployment

The database schema should be automatically created during deployment. If manual intervention is needed:

```
# Run this command in the Vercel deployment environment or locally with production
DATABASE_URL
npx prisma migrate deploy
```

For Manual Production Setup

If you need to manually set up the database in production:

```
# 1. Ensure DATABASE_URL is set in environment variables
echo $DATABASE_URL

# 2. Push schema to production database
npx prisma db push

# 3. Generate Prisma client
npx prisma generate
```

Verification Steps

1. Check Database Connection

```
npx prisma db pull
```

2. Verify Schema Sync

```
npx prisma db push --preview-feature
```

3. Test AI Insights API

```
curl -X GET "https://your-domain.com/api/ai/insights?venueId=test-venue-id"
```

Current Status

-  TypeScript compilation errors resolved
-  Database connection working
-  Prisma schema synchronized
-  AI Insights route fixed
-  Changes committed and pushed to repository

Build Notes

- The local build completed successfully but ran out of memory during optimization
- This is a local environment limitation and should not affect Vercel deployment
- Vercel has proper memory allocation for production builds

Next Steps

1. **Monitor Deployment:** Watch the Vercel deployment logs for any remaining issues
2. **Test API Endpoints:** Verify that the AI insights API works correctly
3. **Database Monitoring:** Ensure all tables are created and accessible
4. **Performance Testing:** Test the application under load

Support

If you encounter any issues during deployment:

1. Check Vercel deployment logs
2. Verify DATABASE_URL environment variable is set correctly
3. Ensure all required environment variables are configured
4. Run `npx prisma migrate deploy` if schema issues persist
